Professional Summary

Backend Engineer with 6+ years of experience building backend and event-driven systems with Java, Spring Boot, Kafka, PostgreSQL, Redis, Elasticsearch, and AWS. Currently working on financial reporting workflows supporting regulatory reporting, with a focus on backend services, data validation, asynchronous processing, and reliability. Previously built document processing and CDC-based search systems handling high-volume data. Comfortable working across application code, messaging, databases, testing, and observability.

Technical Skills

Languages: Java (JDK 17), Python, SQL
Backend: Spring Boot, Spring Security, Spring Data JPA, REST APIs, Microservices
Messaging: Apache Kafka, Kafka Streams, Kafka Connect, AWS SQS, AWS SNS
Data: PostgreSQL, DynamoDB, Redis, Elasticsearch
Cloud: AWS (S3, Lambda, EventBridge, EC2, IAM, CloudWatch), Docker
Architecture: Event-Driven Architecture, Distributed Systems, Transactional Outbox, Idempotency, CDC, Audit Logging
Testing: JUnit 5, Mockito, Testcontainers, JMeter, Integration & Load Testing
DevOps & Observability: Maven, GitHub Actions, OpenTelemetry, Prometheus, Grafana, ELK

Experience

Infosys **February 2026 - Present**
Consultant *Hyderabad, Telangana*

- Enhanced backend services for a financial reporting platform supporting regulatory reporting workflows. Developed Java/Spring Boot components for data validation, mapping, consolidation, and report generation across multiple services, with reporting cycles handling 50K+ records.
- Worked on Kafka-based processing between reporting services, adding retry and dead-letter handling for failed messages and making consumers idempotent so duplicate events could be processed safely.
- Developed configurable validation and mapping components covering 20+ business rules for data-quality checks, missing fields, and invalid values, reducing manual validation effort by 30% across test datasets.
- Enhanced report approval workflows with state-based transitions, optimistic locking, and audit logging. This helped prevent conflicting updates when reports were reviewed concurrently and provided traceability across the reporting lifecycle.
- Improved processing performance by 20% in load-test scenarios involving 100K+ records by tuning database queries, increasing Kafka consumer parallelism, and introducing Redis caching where repeated lookups were involved.
- Added OpenTelemetry, Prometheus, and Grafana instrumentation for API latency, processing failures, distributed traces, and Kafka consumer lag. Also expanded automated tests with JUnit 5, Mockito, and Testcontainers, reaching 85% coverage across owned components.

Tata Consultancy Services **August 2020 - January 2026**
IT Analyst *Kolkata, West Bengal*

- Built Spring Boot microservices for an internal document processing platform handling 5,000+ scanned PDFs/images per day. Kafka was used to decouple processing stages, while AWS Textract, S3, Lambda, and EventBridge handled OCR, storage, and asynchronous processing. Reduced manual processing time by 80%.
- Replaced SQL-based text search with Elasticsearch and built a CDC pipeline using Debezium, Kafka Connect, and Kafka Streams to synchronize 2M+ PostgreSQL records with the search index. Updates reached Elasticsearch in under 5 minutes, while search latency improved by 70%.
- Built an event-driven feedback routing workflow using Kafka, AWS Lambda, and EventBridge, integrating lightweight NLP models for automated classification and routing. Reduced manual routing effort by 60% while maintaining 90%+ classification accuracy.

Education

MAKAUT **Aug. 2016 – Aug 2020**
Bachelor of Technology in Computer Science *Asansol, West Bengal*
